

### Description

Prefill and Exhaust valves model **PV\*\*** are seat type check valves, allowing free flow from its port **A** to port **B** and leak-free closure in opposite direction. For reverse flow, these valves can be opened by applying pilot pressure to its port **X**.

The valves are designed for the purpose of pre-filling large cylinders during their rapid approach motions, which are actuated mean like a pair of kicker cylinders or jack up cylinders or by gravitational force.

These valves have very low cracking pressure and generous internal passage to help them to offer least possible pressure drop while pre-filling.

Due to low pressure drop, these valves also can handle much higher exhaust flow enabling rapid return of the cylinders.

For connectivity, it's **A** port is machined as per Port dimensions for Flanged connection ISO 6162.

The special cavity for the **B** port helps the user to mount these valves directly on the cylinders, thus further reducing the pressure drop in the line.

A hydraulic system having Prefill valve without decompression feature, must have an external arrangement of decompressing the oil in the cylinder, before the valve is opened.

**Technical specifications**

- Construction ..... Poppet type, Pilot operated.
- Mounting ..... Inside oil tank mouting or flanged A port, as per ISO 6162  
Special machined cavity for port B.
- Mounting position ..... Optional
- Flow direction ..... Free flow from port A to port B.  
Piloted flow from port B to port A
- Maximum operating pressure..... At port A 16 bar  
At port B and port X 315 bar
- Cracking pressure..... 0.2 bar
- Pilot pressure required to have flow.....  
from port B to port A.  $P_x > 2 \times P_b - P_a + 8$  bar (to open main poppet of the valve)  
 $P_x > P_b / 5 - (1.2 \times P_a) + 8$  bar (to open decompression poppet of the valve)  
Where  $P_x$  = Pilot pressure at port X (bar)  
 $P_a$  = Pressure at port A (bar)  
 $P_b$  = Pressure at port B (bar)

Pilot Volume.....

- Oil velocity during pre-filling (Suction)..... Refer figure below
- Hydraulic medium ..... Mineral oil.
- Viscosity range ..... 10 cSt to 380 cSt
- Fluid temperature range ..... -20°C to +80°C
- Fluid cleanliness requirement ..... ISO 4406 20/18/15 or better.
- Mass ..... Refer table on page 2.

Oil velocity during prefilling (suction) for different arrangements
